Hiring Team

Subject: Application for Engineering Manager

Dear Hiring Team,

I am applying for the Engineering Manager position. With more than 16 years of experience in software development and over 7 years in technical leadership roles, I have been responsible for architecture, modernization initiatives, and team leadership across enterprise systems built primarily on .NET and relational databases.

In my current role as System Analyst & Technological Lead, I own the backend architecture of financial processing platforms handling high-volume transactions. My responsibilities include defining system architecture, API contracts, and data ownership boundaries, while ensuring production stability and structured CI/CD practices. I lead modernization efforts toward service-oriented and scalable designs and work closely with infrastructure teams to maintain operational reliability. Alongside delivery, I focus on maintaining engineering standards and managing technical debt in a controlled manner.

Previously, I led cross-functional teams at Enosis Solutions, working on .NET Core and SQL Server-based enterprise systems. I was involved in sprint planning, architectural decisions, mentoring engineers, and coordinating production releases with DevOps. Several projects involved modernizing legacy systems into cloud-hosted SaaS platforms, with emphasis on scalability, maintainability, and long-term sustainability.

I have extensive experience with Microsoft SQL Server and other relational databases, distributed systems, API-based integrations, and systems developed by multiple teams. I am comfortable working in both Windows and Linux environments and understand the operational aspects of production systems, including performance tuning and reliability.

As a leader, I value clear communication, realistic planning, and consistent engineering discipline. I aim to support team development while ensuring stable and predictable delivery. Having worked with international teams and clients, I am accustomed to collaborating across cultures and aligning technical decisions with product goals.

I am interested in contributing to a technically strong organization where modernization, system quality, and long-term thinking are priorities. I look forward to the opportunity to discuss how my experience can be relevant to your team.

Sincerely,
Muhammad Zahidur Rahman
